# 1 About This Document

---

## 1.1 Scope

This document describes single radio voice call continuity (SRVCC), including its technical principles, related features, network impact, and engineering guidelines.

This document covers the following features:

- TDLOFD-001022 SRVCC to UTRAN
- TDLOFD-001023 SRVCC to GERAN

Any managed objects (MOs), parameters, alarms, or counters described herein correspond to the software release delivered with this document. Any future updates will be described in the product documentation delivered with future software releases.

This document applies only to LTE TDD. Any "LTE" in this document refers to LTE TDD, and "eNodeB" refers to LTE TDD eNodeB.

This document applies to the following types of eNodeBs.

eNodeB Type	Model
Macro	DBS3900 LTE TDD
LampSite	DBS3900 LampSite TDD
Micro	BTS3205E

## 1.2 Intended Audience

This document is intended for personnel who:

- Need to understand the features described herein
- Work with Huawei products

## 1.3 Change History

This section provides information about the changes in different document versions. There are two types of changes:

- Feature change
  - Changes in features and parameters of a specified version as well as the affected entities
- Editorial change
  - Changes in wording or addition of information Editorial change does not specify the affected entities.

### eRAN TDD 11.1 01 (2016-03-07)

This issue does not include any changes.

### eRAN TDD 11.1 Draft A (2015-12-30)

Compared with Issue 01 (2015-09-20) of eRAN TDD 11.0, Draft A (2015-12-30) of eRAN TDD 11.1 includes the following changes.

Change Type	Change Description	Parameter Change	Affected Entity
Feature change	Added cell-level switch parameters for coverage-based SRVCC. For details, see <a href="#">3.1 Triggering</a> .	<p>Added the following information:</p> <ul style="list-style-type: none"><li>● <b>UtranSrvccSwitch</b> of the <b>CellHoParaCfg.HoModeSwitch</b> parameter</li><li>● <b>GeranSrvccSwitch</b> of the <b>CellHoParaCfg.HoModeSwitch</b> parameter</li></ul>	Macro, micro, and LampSite eNodeBs
Editorial change	Optimized the CME-related operation description in Engineering Guidelines.	None	N/A

## 1.4 Differences Between eNodeB Types

When triggering CS+PS SRVCC, macro and LampSite eNodeBs act in a different way than micro eNodeBs. For details, see [3.3.1 SRVCC to UTRAN](#).

# 2 Overview

---

In the early phase of E-UTRAN deployment, when UEs running voice services move out of an E-UTRAN network, the voice services can continue by means of the following solutions.

- UEs running VoIP services can be handed over to the UTRAN or GERAN using PS handover. This requires support from the UTRAN or GERAN and UEs.
- UEs running VoIP services can be handed over to the UTRAN or GERAN using SRVCC, which transforms the VoIP services into CS services.

This document describes SRVCC. SRVCC is a means of inter-RAT handover. For details, see section 4.1.2 "Architectural Principles for 3GPP UTRAN/GERAN SRVCC and vSRVCC" in 3GPP TS 23.216 V11.1.0.

## 2.1 Definition

SRVCC enables VoIP services to be carried in the circuit switched (CS) domain, ensuring voice service continuity.

## 2.2 Benefits

Before the E-UTRAN is deployed across coverage areas, SRVCC is used to ensure voice service continuity.

## 2.3 Architecture

### 2.3.1 SRVCC

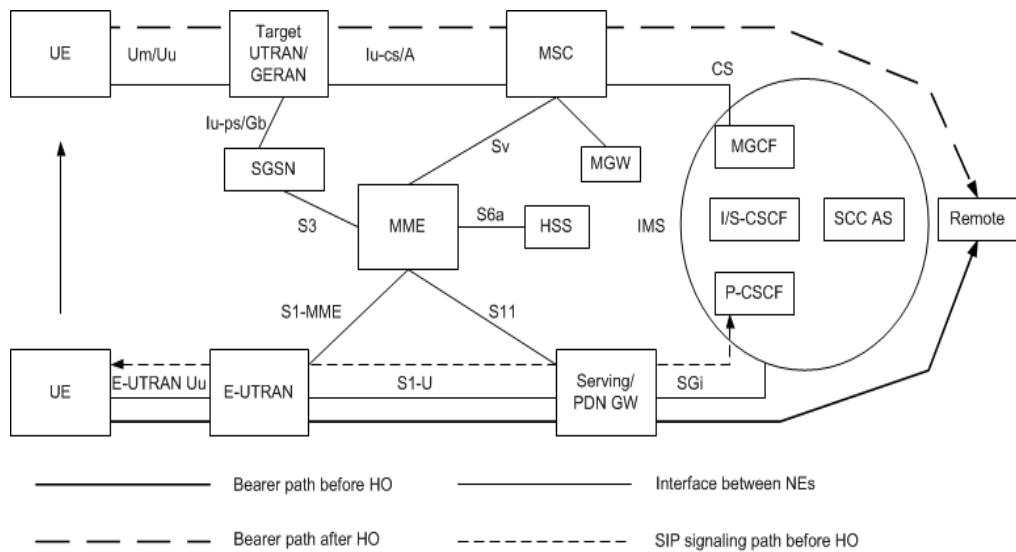

SRVCC consists of the following activities. [Figure 2-1](#) shows the SRVCC network architecture.

- SRVCC consists of the following activities:
- Access-stratum handover between bearer networks

To support SRVCC, the Sv interface is introduced between the MSC server and MME. The MSC server is used for signaling interaction for SRVCC handovers. The overall SRVCC procedure is as follows:

1. The MME informs the MSC server through the Sv interface that a VoIP service is to be handed over to the CS domain.
2. The MSC server instructs the UTRAN or GERAN to prepare for the handover.
3. The MSC server requests that the media gateway (MGW) provide the new media-plane information, including the IP address and port number. It then notifies the service centralization and continuity application server (SCC AS) that the media stream is to be changed.
4. The SCC AS notifies the UE of the new media-plane information. The UE establishes a new media stream to the MGW and releases the original media stream.
5. When the UE uses the VoIP voice calls, the MGW needs to convert the media stream to achieve interworking between the CS voice stream and VoIP voice stream. The conversion occurs in protocol stacks and voice coding.

**Figure 2-1** SRVCC network architecture

**Table 2-1** lists the elements of the network architecture in **Figure 2-1**.

**Table 2-1** Elements of SRVCC network architecture

Element	Function
Sv interface	Supports signaling interaction for SRVCC handovers as an interface between the MME and MSC server.
E-UTRAN	Supports the SRVCC procedure, which in the E-UTRAN is similar to a PS handover procedure. During the SRVCC procedure, the E-UTRAN sends an SRVCC indication to the MME, notifying the MME of whether the target cell supports SRVCC and concurrent CS and PS handovers.
UTRAN/GERAN	<ul style="list-style-type: none"> <li>Supports incoming CS handovers for CS-only SRVCC.</li> <li>Supports concurrent incoming CS and PS handovers for CS-and-PS SRVCC.</li> </ul>
MME	<ul style="list-style-type: none"> <li>Provides the bearer splitting function to separate the voice bearer from non-voice bearers.</li> <li>Initiates an SRVCC procedure over the Sv interface for an emergency call and includes an emergency indication in the transmitted message.</li> <li>Selects the MSC server that supports SRVCC based on the domain name server (DNS) procedures or local configuration.</li> </ul>
MSC problem analysis	Processes CS handovers and session transfers.
SGSN	Processes PS handovers for CS-and-PS SRVCC.
P-CSCF	Acts as the first contact point for UEs in the IMS that provides the proxy function by accepting and forwarding service requests, but does not change the Request URI field in the INVITE message.

Element	Function
S-CSCF	Acts as the control center of the IMS, implements UE registration and authentication and session control, and provides basic session routing for calling and called parties on the IMS.
I-CSCF	Assigns S-CSCFs to UEs, supports route query, and forwards SIP requests to another IMS domain.
MGCF	Enables interworking between the IMS control plane and the legacy CS network.
SCC AS	Ensures the centralization and continuity of VoIP services on the E-UTRAN network.

### 2.3.2 eSRVCC

Although the signaling-plane handover of an SRVCC procedure can be completed within 300 ms, the session transfer cannot. As a result, the total service interruption period during SRVCC does not meet the following requirement: The service interruption period during the handover of a real-time service between the E-UTRAN and the UTRAN or GERAN must be less than 300 ms. For details about this requirement, see section 8.4 "Co-existence and interworking with 3GPP RAT" in 3GPP TS 25.913 V8.0.0. To shorten the service interruption time, 3GPP Release 10 proposes eSRVCC.

eSRVCC focuses on reducing the time for session transfer because session transfer prolongs the service interruption period for SRVCC, especially when the calling and called parties are being served by different networks or when a UE is roaming.

eSRVCC is implemented by adding the ATCF or ATGW functional entity between the P-CSCF and I-CSCF or S-CSCF. [Figure 2-2](#) shows the eSRVCC network architecture.

- Access Transfer Control Function (ATCF)

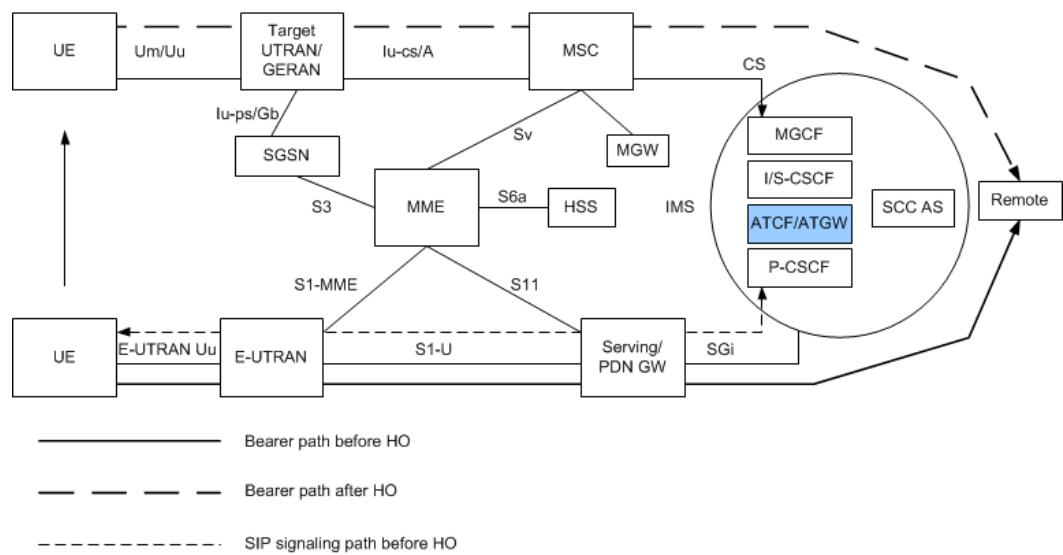

The ATCF acts as an anchor point for the signaling plane before and after handovers. To reduce delay, the ATCF must be deployed on the serving network. (The visited network is the serving network for roaming UEs.) In this manner, the MSC server can be located close to the ATCF to shorten the time for signaling routing from the MSC server to the ATCF in roaming scenarios.

- Access Transfer Gateway (ATGW)

The ATGW acts as a media-plane anchor point for VoIP services before and after handovers. The media plane of the VoIP service is anchored to the ATGW. When an SRVCC procedure is initiated for this UE, the media-plane information is updated only on the ATGW, but not on the peer UE, to shorten the handover duration. This avoids the incurred media-plane interruption period.

For a UE running a voice service that may require SRVCC later, the media plane of the service is anchored to the ATGW. When an SRVCC procedure is initiated for this UE, the media-plane information is updated only on the ATGW, but not on the peer UE, to shorten the handover duration.

**Figure 2-2 eSRVCC network architecture**

**NOTE**

This document focuses on eNodeB functions, which are the same for SRVCC and eSRVCC. Therefore, the following sections do not distinguish between SRVCC and eSRVCC. On live networks, eSRVCC is used.

# 3 SRVCC Principles

## 3.1 Triggering

### Common Causes

Several factors may trigger SRVCC to UTRAN. For detailed measurement triggering, see the documents listed in **Table 3-1**.

**Table 3-1** Mapping between documents and features/functions

Feature/Function	Switch for SRVCC to UTRAN	Switch for SRVCC to GERAN	Document
Coverage-based SRVCC	<b>UtranSrvcSwitch</b> of the <b>CellHoParaCfg.HoModeSwitch</b> parameter	<b>GeranSrvcSwitch</b> of the <b>CellHoParaCfg.HoModeSwitch</b> parameter	<i>Inter-RAT Mobility Management in Connected Mode Feature Parameter Description</i>
Service-based SRVCC	<b>UtranServiceHoSwitch</b> under the <b>ENodeBAlgoSwitch.HoAlgoSwitch</b> parameter	<b>GeranServiceHoSwitch</b> under the <b>ENodeBAlgoSwitch.HoAlgoSwitch</b> parameter	
Distance-based SRVCC	<b>UTRAN</b> under the <b>CellAlgoSwitch.DistBasedHoSwitch</b> and <b>DistBasedHO.DistBasedMeasObjType</b> parameters	<b>GERAN</b> under the <b>CellAlgoSwitch.DistBasedHoSwitch</b> and <b>DistBasedHO.DistBasedMeasObjType</b> parameters	
Uplink-quality-based SRVCC	<b>UIQualityInterRATHoSwitch</b> under the <b>ENodeBAlgoSwitch.HoAlgoSwitch</b> parameter		

Feature/Function	Switch for SRVCC to UTRAN	Switch for SRVCC to GERAN	Document
Load-based SRVCC	<b>UtranMlbSwitch</b> under the <b>CellAlgoSwitch.MlbAlgoSwitch</b> parameter	<b>GeranMlbSwitch</b> under the <b>CellAlgoSwitch.MlbAlgoSwitch</b> parameter	<i>MLB Feature Parameter Description</i>
SPID-based SRVCC	<b>InterPlmnHoSwitch</b> under the <b>SpidCfg.HoBackToHPLMNSwitch</b> and <b>ENodeBAlgoSwitch.HoAlgoSwitch</b> parameters		<i>Flexible User Steering Feature Parameter Description</i>

#### NOTE

In addition, coverage-based SRVCC is controlled by the **UtranSrvccSwitch** option of the **ENodeBAlgoSwitch.HoModeSwitch** parameter or the **GeranSrvccSwitch** option of the **ENodeBAlgoSwitch.HoModeSwitch** parameter.

If the option of the eNodeB-level parameter is selected, the option of the cell-level parameter does not take effect. If the option of the eNodeB-level parameter is cleared, the option of the cell-level parameter takes effect.

The eNodeB-level parameter will no longer be used in later versions. Therefore, you are advised to use the cell-level parameter.

## Location Service (LCS)

LCS-based SRVCC is controlled by **LcsSrvccSwitch** under the **ENodeBAlgoSwitch.HoModeSwitch** parameter. It also depends on the UTRAN or GERAN LCS capability, which is controlled by the **CSFallbackBlindHoCfg.UtranLcsCap** or **CSFallbackBlindHoCfg.GeranLcsCap** parameter, respectively.

LCS-based SRVCC is used when a UE triggers LCS in an LCS-incapable E-UTRAN network. When the UE triggers LCS, the MME delivers a CS Fallback Indicator to the eNodeB. The eNodeB performs SRVCC to hand the UE over to the CS domain for LCS while ensuring voice service continuity.

The target cell signal requirements for LCS-based SRVCC are the same as those for CSFB to UTRAN or GERAN. For details about the requirements, see *CS Fallback Feature Parameter Description*.

## 3.2 Measurements and Decision-making

### 3.2.1 Basic Measurements and Decision-making

The procedures of coverage-, service-, distance-, and UL-quality-based SRVCC measurements and handover target selection are the same as those defined in inter-RAT mobility management in connected mode. For details, see sections "Measurements" and "Decision-making" in *Overview of Mobility Management in Connected Mode*.

The coverage-based measurement of SRVCC to GERAN is enhanced. This enhancement is controlled by the **GSM\_MEAS\_DEL\_INTERFREQ\_SW** option of the

**CellAlgoSwitch.MeasOptAlgoSwitch** parameter. When this option is selected, perform the following operations:

- When the UE is performing VoIP services, the eNodeB releases the inter-frequency measurement after the coverage-based GSM measurement is triggered.
- When the UE starts VoIP services after the coverage-based GSM measurement is triggered, the eNodeB releases all the inter-frequency measurement.

After the coverage-based GERAN measurement is triggered, inter-frequency measurement is prohibited if VoIP services exist.

For details about the procedure of load-based SRVCC measurements and handover target selection, see *MLB Feature Parameter Description*.

If SRVCC is triggered by the SPID-based inter-RAT handover function, the SPID-based filter is applied during measurement control and target cell selection. For details, see *Flexible User Steering Feature Parameter Description*.

## 3.3 Execution

If SRVCC to UTRAN and SRVCC to GERAN are supported on the network, the eNodeB delivers measurement configurations, instructing the UEs to measure neighboring UTRAN and GERAN cells. Cells in the first valid measurement report are selected as target cells for SRVCC.

### 3.3.1 SRVCC to UTRAN

**Figure 3-1** shows the handover policy selection process to UTRAN when bearers of QCI 1 exist. The handover selection sequence is as follows:

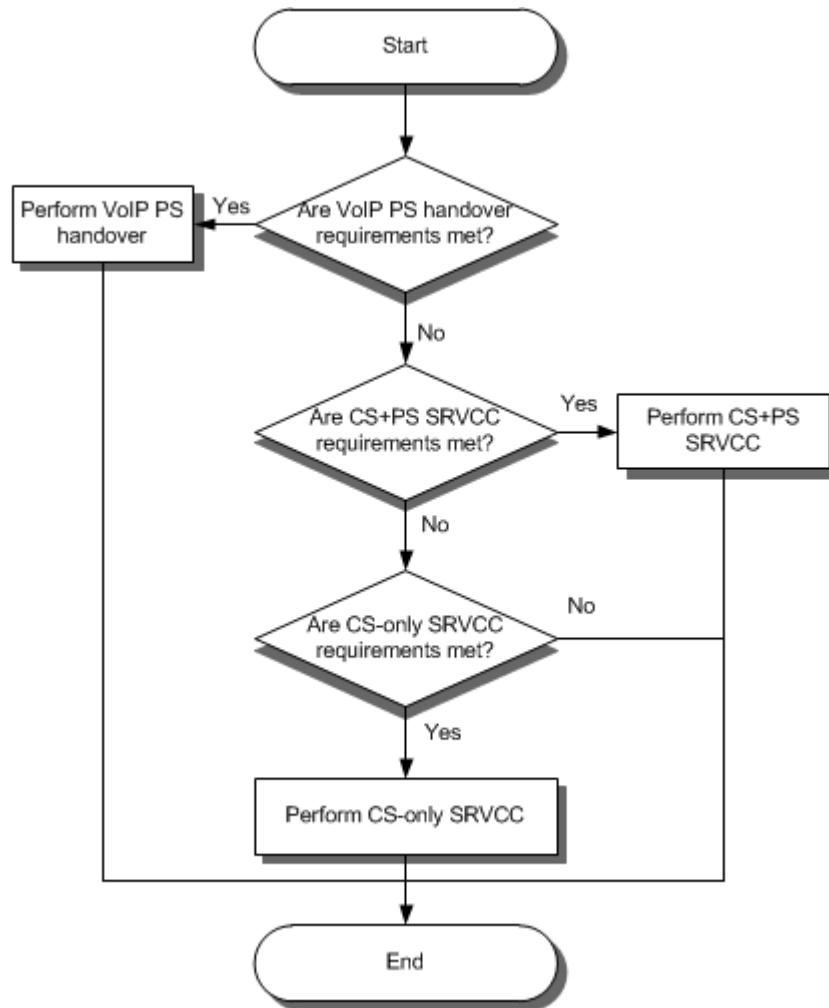

1. VoIP PS handover
2. CS+PS SRVCC
3. CS-only SRVCC

If requirements of the preceding three handovers are not met, no handover is performed.

#### NOTE

The redirection cannot function as the handover policy for QCI 1 VoIP services. Otherwise, call drops occur. The redirection handover is controlled by the **REDIRECTION** option of the **InterRatPolicyCfgGroup.UtranHoCfg** parameter.

**Figure 3-1** SRVCC policy selection process from E-UTRAN to UTRAN

## VoIP PS Handover

The VoIP PS handover from E-UTRAN to UTRAN is controlled by the **UtranVoipCapSwitch** option of the **ENodeBAlgoSwitch.HoModeSwitch** parameter.

## CS+PS SRVCC

To trigger CS+PS SRVCC, you must perform the following operations:

- Enable SRVCC from E-UTRAN to UTRAN, which is controlled by the **UtranSrvccSwitch** option of the cell-level parameter **CellHoParaCfg.HoModeSwitch**.

**NOTE**

In addition, this function is controlled by the **UtranSrvccSwitch** option of the eNodeB-level parameter **ENodeBAlgoSwitch.HoModeSwitch**.

If the option of the eNodeB-level parameter is selected, the option of the cell-level parameter does not take effect. If the option of the eNodeB-level parameter is cleared, the option of the cell-level parameter takes effect.

The eNodeB-level parameter will no longer be used in later versions. Therefore, you are advised to use the cell-level parameter.

- Enable PS handover from E-UTRAN to UTRAN, which is controlled by the **UtranPsHoSwitch** option of the cell-level parameter **CellHoParaCfg.HoModeSwitch**.

 **NOTE**

In addition, this function is controlled by the **UtranPsHoSwitch** option of the eNodeB-level parameter **ENodeBAalgoSwitch.HoModeSwitch**.

If the option of the eNodeB-level parameter is selected, the option of the cell-level parameter does not take effect. If the option of the eNodeB-level parameter is cleared, the option of the cell-level parameter takes effect.

The eNodeB-level parameter will no longer be used in later versions. Therefore, you are advised to use the cell-level parameter.

- Select the **SRVCC** and **PS\_HO** options of the **InterRatPolicyCfgGroup.UtranHoCfg** parameter. Set the **StandardQci.InterRatPolicyCfgGroupId** or **ExtendedQci.InterRatPolicyCfgGroupId** parameter to configure the handover policy for the corresponding QCI.

If services with different QCIs exist, the handover policy for the highest-priority QCI prevails. The handover policy priority of each QCI is controlled by the **CellStandardQCI.QciPriorityForHo** parameter. You are advised to set the handover policy priority of QCI 1 to 1 (highest) and that of QCI 5 to 9 (lowest).

 **NOTE**

- For mandatory handovers, for example, coverage-based and UL-quality-based handovers, SRVCC can be triggered when SRVCC is configured in the inter-RAT handover policy groups for the highest-priority QCI.
- For optional handovers, for example, load-based, service-based, and CSFB-based handovers, SRVCC can be triggered when SRVCC is configured in the inter-RAT handover policy groups for all QCIs.
- Enable UTRAN cell CS and PS handover indication, which is controlled by the **UtranExternalCell.CsPsHOInd** parameter. If this parameter is set to **BOOLEAN\_FALSE(False)**, the external UTRAN cell does not support SRVCC for concurrent CS and PS services. If this parameter is set to **BOOLEAN\_TRUE(True)**, the external UTRAN cell supports SRVCC for concurrent CS and PS services.

For macro and LampSite eNodeBs, when triggering SRVCC for CS+PS services, the eNodeB decides whether to check CS and PS handover indication of the external UTRAN cell based on the **CnOperatorHoCfg.SrvccWithPsBasedCellCapSw** parameter.

- When this parameter is set to **ON**, the eNodeB does not check the **CsPsHOInd** parameter of external UTRAN cells.
- When this parameter is set to **OFF**, the eNodeB checks the **CsPsHOInd** parameter of external UTRAN cells.

For micro eNodeBs, when triggering SRVCC for CS and PS services, the eNodeB does not support the **CnOperatorHoCfg.SrvccWithPsBasedCellCapSw** parameter and checks CS and PS handover indication of the external UTRAN cell directly.

## CS-only SRVCC

To trigger CS-only SRVCC, you must perform the following operations:

- Enable SRVCC from E-UTRAN to UTRAN, which is controlled by the **UtranSrvccSwitch** option of the cell-level parameter **CellHoParaCfg.HoModeSwitch**.

 **NOTE**

In addition, this function is controlled by the **UtranSrvccSwitch** option of the eNodeB-level parameter **ENodeBAlgoSwitch.HoModeSwitch**.

If the option of the eNodeB-level parameter is selected, the option of the cell-level parameter does not take effect. If the option of the eNodeB-level parameter is cleared, the option of the cell-level parameter takes effect.

The eNodeB-level parameter will no longer be used in later versions. Therefore, you are advised to use the cell-level parameter.

- Select the **SRVCC** option of the **InterRatPolicyCfgGroup.UtranHoCfg** parameter. Set the **StandardQci.InterRatPolicyCfgGroupId** or **ExtendedQci.InterRatPolicyCfgGroupId** parameter to configure the handover policy for the corresponding QCI.  
If services with different QCIs exist, the handover policy for the highest-priority QCI prevails. The handover policy priority of each QCI is controlled by the **CellStandardQCI.QciPriorityForHo** parameter. You are advised to set the handover policy priority of QCI 1 to 1 (highest) and that of QCI 5 to 9 (lowest).

 **NOTE**

- For mandatory handovers, for example, coverage-based and UL-quality-based handovers, SRVCC can be triggered when SRVCC is configured in the inter-RAT handover policy groups for the highest-priority QCI.
- For optional handovers, for example, load-based, service-based, and CSFB-based handovers, SRVCC can be triggered when SRVCC is configured in the inter-RAT handover policy groups for all QCIs.

### 3.3.2 SRVCC to GERAN

**Figure 3-2** shows the handover policy selection process to GERAN when bearers with QCI of 1 exist. The handover selection sequence is as follows:

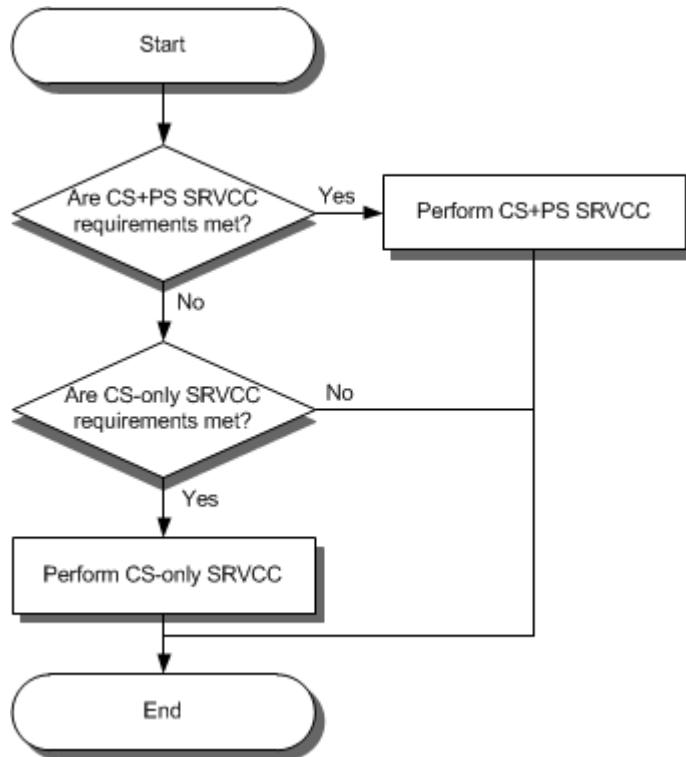

1. CS+PS SRVCC
2. CS-only SRVCC

If requirements of the preceding two handovers are not met, no handover is performed.

 **NOTE**

If bearers with a QCI of 1 are used to carry VoIP services and the redirection handover for QCI 1 is enabled, a call drop may occur during redirection. Therefore, the redirection cannot function as the handover policy for QCI 1 VoIP services. The redirection handover is controlled by the **REDIRECTION** option of the **InterRatPolicyCfgGroup.GeranGprsEdgeHoCfg** parameter.

**Figure 3-2** SRVCC policy selection process from E-UTRAN to GERAN

## CS+PS SRVCC

To trigger CS+PS SRVCC, you must perform the following operations:

- Select the **GeranSrvccSwitch** option of the **ENodeBAlgoSwitch.HoModeSwitch** parameter.
- Select the **GeranPsHoSwitch** option of the **ENodeBAlgoSwitch.HoModeSwitch** parameter.
- Select the **SRVCC** and **PS\_HO** options of the **InterRatPolicyCfgGroup.GeranGprsEdgeHoCfg** parameter. Set the **StandardQci.InterRatPolicyCfgGroupId** or **ExtendedQci.InterRatPolicyCfgGroupId** parameter to configure the handover policy for the corresponding QCI.

If services with different QCIs exist, the handover policy for the highest-priority QCI prevails. The handover policy priority of each QCI is controlled by the **CellStandardQCI.QciPriorityForHo** parameter. You are advised to set the handover policy priority of QCI 1 to 1 (highest) and that of QCI 5 to 9 (lowest).

### NOTE

- For mandatory handovers, for example, coverage-based and UL-quality-based handovers, SRVCC can be triggered when SRVCC is configured in the inter-RAT handover policy groups for the highest-priority QCI.
- For optional handovers, for example, load-based, service-based, and CSFB-based handovers, SRVCC can be triggered when SRVCC is configured in the inter-RAT handover policy groups for all QCIs.
- Enable GERAN cell capability identity, which is controlled by the **GeranExternalCell.CsPsHOInd** parameter.

## CS-only SRVCC

To trigger CS-only SRVCC, you must perform the following operations:

- Select the **GeranSrvccSwitch** option of the **ENodeBAlgoSwitch.HoModeSwitch** parameter.
- Select the **SRVCC** option of the **InterRatPolicyCfgGroup.GeranGsmHoCfg** parameter and the **SRVCC** option of the **InterRatPolicyCfgGroup.GeranGprsEdgeHoCfg** parameter. Set the **StandardQci.InterRatPolicyCfgGroupId** or **ExtendedQci.InterRatPolicyCfgGroupId** parameter to configure the handover policy for the corresponding QCI.

If services with different QCIs exist, the handover policy for the highest-priority QCI prevails. The handover policy priority of each QCI is controlled by the **CellStandardQCI.QciPriorityForHo** parameter. You are advised to set the handover policy priority of QCI 1 to 1 (highest) and that of QCI 5 to 9 (lowest).

 **NOTE**

- For mandatory handovers, for example, coverage-based and UL-quality-based handovers, SRVCC can be triggered when SRVCC is configured in the inter-RAT handover policy groups for the highest-priority QCI.
- For optional handovers, for example, load-based, service-based, and CSFB-based handovers, SRVCC can be triggered when SRVCC is configured in the inter-RAT handover policy groups for all QCIs.

### 3.3.3 Retry and Penalty

**Table 3-2** describes retry and penalty mechanisms for SRVCC triggered by various causes.

**Table 3-2** Retry and penalty mechanisms for SRVCC triggered by different features or functions

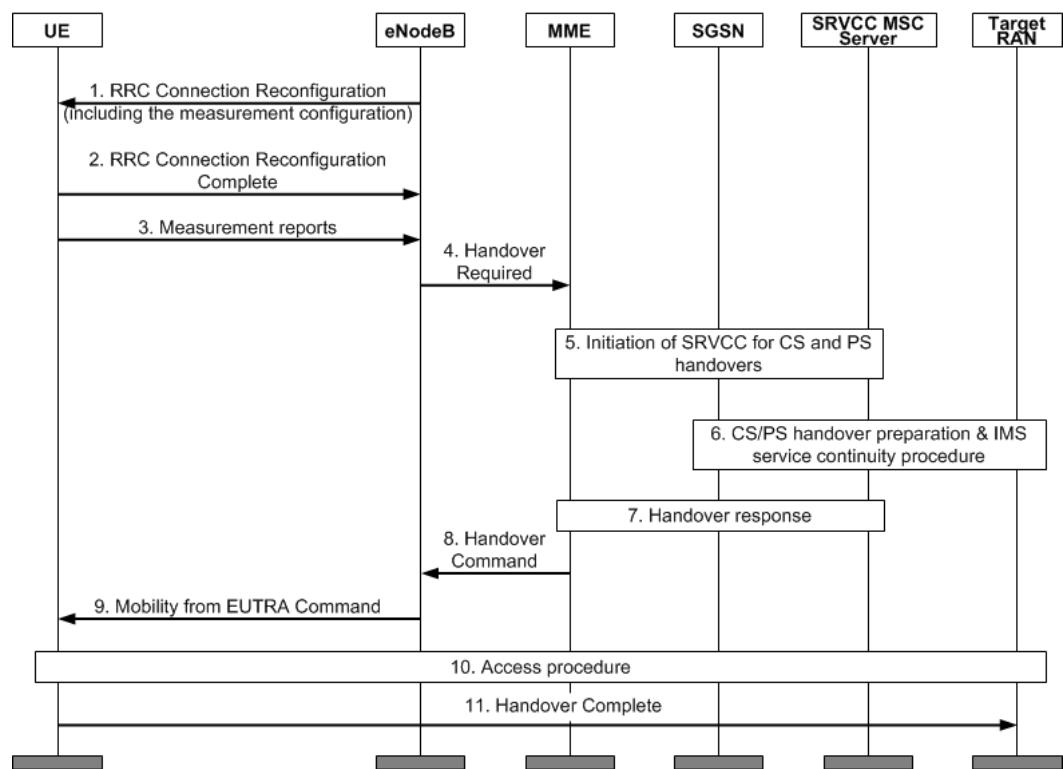

Triggering Cause	Retry and Penalty Mechanism
<ul style="list-style-type: none"> <li>● Coverage-based inter-RAT handover to UTRAN</li> <li>● Service based inter-RAT handover from E-UTRAN to UTRAN</li> <li>● Distance based Inter-RAT handover to UTRAN</li> <li>● UL-quality-based inter-RAT handover to UTRAN</li> <li>● Coverage-based inter-RAT handover to GERAN</li> <li>● Service based inter-RAT handover to GERAN</li> <li>● Distance based inter-RAT handover to GERAN</li> <li>● UL-quality-based inter-RAT handover to GERAN</li> <li>● SPID-based inter-RAT handover</li> </ul>	Mobility Management in Connected Mode
<ul style="list-style-type: none"> <li>● Load-based inter-RAT handover to UTRAN</li> <li>● Load-based inter-RAT handover to GERAN</li> </ul>	Inter-RAT Mobility Load Balancing

# 4 Signaling Procedure

## SRVCC Triggered by Common Causes

**Figure 4-1** shows the signaling procedure for SRVCC from E-UTRAN to UTRAN. (The procedure for SRVCC from E-UTRAN to GERAN is the same.) (The procedure for SRVCC to GERAN is the same.) For details, see section 6.2 "E-UTRAN and 3GPP GERAN/UTRAN SRVCC" in 3GPP TS 23.216 V9.4.0.

**Figure 4-1** Signaling procedure for SRVCC to UTRAN/GERAN

1. The eNodeB delivers the inter-RAT measurement configuration to the UE.
2. The UE responds to the eNodeB with an RRC Connection Reconfiguration Complete message.

3. After detecting that a neighboring cell meets the condition for triggering an inter-RAT handover, the UE sends a measurement report to the eNodeB.
4. The eNodeB determines that a handover should be performed and sends a Handover Required message containing an SRVCC HO Indication to the MME.
5. The MME splits voice bearers from non-voice bearers, and then transmits a Relocation Request message to both the MSC and the target SGSN.
6. After receiving the Relocation Request message, target SGSN prepares for a handover of PS services, which is the same as an inter-RAT PS handover procedure. The UE media plane is then transferred on the IMS.

 **NOTE**

If the value of the SRVCC HO Indication information element (IE) is "CS Only" in the Handover Required message sent from the eNodeB to the MME, the MME instructs only the MSC server to prepare for a handover. If the value of the SRVCC HO Indication IE is "PS and CS", the MME instructs both the MSC server and SGSN to prepare for a handover.

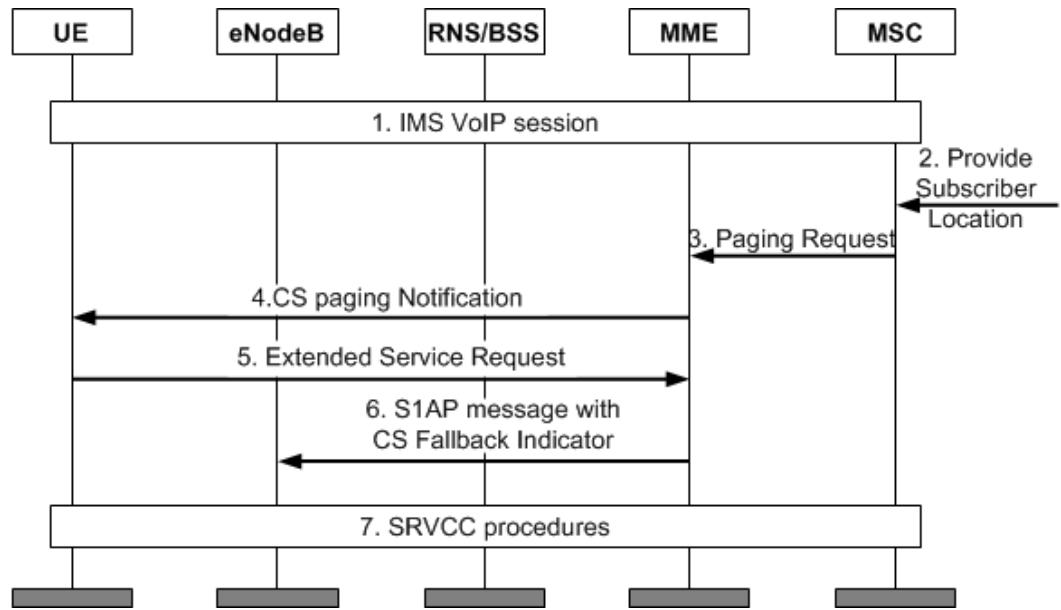

For a CS-only SRVCC procedure, if the target network is UTRAN, the PS services of the UE resume during a routing area update (RAU) procedure in the UTRAN. If the target network is GERAN, PS service handling depends on whether the UE and BSC support Dual Transfer Mode (DTM). If both the UE and BSC support DTM, the PS services of the UE resume during an RAU procedure in the GERAN. If either the UE or the BSC is DTM-incapable, the PS services of the UE are suspended.

7. The MME acts based on the following scenarios:
  - In the CS-only SRVCC scenario, the MME makes a response after receiving a handover preparation complete indication from the target MSC server.
  - In the CS+PS SRVCC scenario, the MME makes a response after receiving a handover preparation complete indication from the target MSC server or target SGSN.
8. The MME delivers a handover command to the eNodeB.
9. The eNodeB delivers a handover command to the UE.
10. After receiving the handover command, the UE accesses the target network.
11. The UE sends the target radio access network (RAN) a Handover Complete message, indicating that the handover procedure for SRVCC is complete.

## LCS-based SRVCC

[Figure 4-2](#) shows the signaling procedure for LCS-based SRVCC.

**Figure 4-2** Signaling procedure for LCS-based SRVCC

Steps in the preceding figure are described as follows:

1. Steps 1 to 5: A CSFB procedure is triggered in an LCS-incapable E-UTRAN network when a UE performing VoIP services triggers an LCS. The procedure for CSFB to E-UTRAN is the same as that for CSFB to UTRAN. For details, see *CS Fallback Feature Parameter Description*.
2. Step 6: The MME sends an S1-AP message with a CS fallback indicator to the eNodeB. The eNodeB learns that the UE is performing VoIP services with a QIC of 1 and the S1-AP message is intended to hand over the UE to another LCS-capable network. Therefore, the eNodeB instructs the UE to measure the LCS-based system and select a target cell.
3. Step 7: The eNodeB determines the target cell and initiates an SRVCC procedure to hand over the UE to the inter-RAT cell that supports LCS.

# 5 Related Features

## 5.1 Features Related to TDLOFD-001022 SRVCC to UTRAN

### Prerequisite Features

Feature ID	Feature Name	Description
TDLOFD-001019	PS Inter-RAT Mobility between E-UTRAN and UTRAN	CS+PS SRVCC depends on TDLOFD-001019 PS Inter-RAT Mobility between E-UTRAN and UTRAN.

### Mutually Exclusive Features

None

### Impacted Features

None

## 5.2 Features Related to TDLOFD-001023 SRVCC to GERAN

### Prerequisite Features

None

### Mutually Exclusive Features

None

## Impacted Features

None

# 6 Network Impact

## 6.1 TDLOFD-001022 SRVCC to UTRAN

### System Capacity

No impact.

### Network Performance

If the target network of a CS-only SRVCC procedure is a UTRAN, only the bearer with QCI 1 is diverted to the CS domain of the target network. Bearers with other QCIs can be reestablished in the PS domain of the target network only after an RAU procedure. The CS-only SRVCC procedure results in a service interruption period of several seconds for PS services. However, the PS+CS SRVCC procedure has a service interruption period of only hundreds of milliseconds for PS services.

## 6.2 TDLOFD-001023 SRVCC to GERAN

### System Capacity

No impact.

### Network Performance

If the target network of a CS-only SRVCC procedure is a DTM-supporting GERAN, only the bearer with QCI 1 is diverted to the CS domain of the target network; bearers with other QCIs complete the RAU procedure and re-establish the PS service in the target network. Otherwise, the bearer with QCI 1 is diverted to GERAN using SRVCC and the PS service is suspended.

During SRVCC to GERAN, the function of releasing inter-frequency measurements after the GSM measurement is triggered improves the call drop rate in the following scenarios:

- The serving cell is not under inter-frequency coverage of an LTE network.
- The serving cell is under coverage of a GSM network.

- The signal of the serving cell attenuates quickly and maintains at least 2s.

This function may increase the call drop rate and the number of handovers to GSM, and decrease the number of inter-frequency handovers and number of reestablishments in the following scenarios:

- The serving cell is under inter-frequency coverage of an LTE network.
- The serving cell is under coverage of a GSM network.
- The signal of the serving cell attenuates quickly and maintains at most 3s.

# 7 Engineering Guidelines

## 7.1 TDLOFD-001022 SRVCC to UTRAN

### 7.1.1 When to Use SRVCC to UTRAN

Use SRVCC to UTRAN if the operator provides IMS-based VoLTE services in an E-UTRAN network and voice services in a legacy UTRAN CS network and while E-UTRANS are not fully deployed across the operator's coverage areas.

For details about when to use VoLTE, see *VoLTE Feature Parameter Description*.

### 7.1.2 Required Information

1. Operating frequencies, coverage areas, and configurations of E-UTRAN and UTRAN cells.
2. Versions and configurations of the NEs in the E-UTRAN, UTRAN, and core networks. Ensure that they all support SRVCC.
3. Operating frequency bands, supported measurement events, and SRVCC capabilities of UMTS+LTE UEs on live networks.

### 7.1.3 Process

To deploy SRVCC to UTRAN, you must complete the following steps:

1. Formulate a neighboring cell plan and configure the neighboring cells accordingly when both UMTS and LTE networks are deployed.
2. Configure parameters of handover thresholds related to SRVCC to UTRAN.
3. Prepare the license file related to SRVCC to UTRAN and configure feature switches related to SRVCC to UTRAN.

### 7.1.4 Requirements

#### Operating Environment

- For the Huawei EPC, the EPC version for eRAN6.0 is required. If the EPC version is not for eRAN6.0, messages may not be parsed.

- For a third party's EPC, the EPC must support SRVCC complying with 3GPP Release 8. Check that software versions for the EPC are correct.

## License

The operator has purchased and activated the license for the feature listed in the following table.

**Table 7-1** License control item for SRVCC to UTRAN

Feature ID	Feature Name	Model	License Control Item	NE	Sales Unit
TDLOFD-001022	SRVCC to UTRAN	LT1STR VCCU00	SRVCC to UTRAN	eNodeB	per RRC Connected User

For SRVCC to UTRAN for combined services, if the UTRAN uses Huawei devices, corresponding licenses need to be activated on the UTRAN. For details, see the engineering guidelines for **WRFD-150215 SRVCC from LTE to UMTS with PS Handover** in *Interoperability Between UMTS and LTE Feature Parameter Description*.

## 7.1.5 Data Preparation and Feature Activation

### 7.1.5.1 Data Preparation

This section describes the data that you need to collect for setting parameters. Required data is data that you must collect for all scenarios. Collect scenario-specific data when necessary for a specific feature deployment scenario.

There are three types of data sources:

- Network plan (negotiation not required): parameter values planned and set by the operator
- Network plan (negotiation required): parameter values planned by the operator and negotiated with the EPC or peer transmission equipment
- User-defined: parameter values set by users

## Required Data

Before configuring SRVCC to UTRAN, collect the data related to neighbor relationships with UTRAN cells. This section provides only the information about managed objects (MOs) related to neighboring UTRAN cells. For more information about how to collect data for the parameters in these MOs, see *Inter-RAT Mobility Management in Connected Mode*. Collect data for the parameters in the following MOs:

1. **UtranNFreq**: used to configure a neighboring UTRAN frequency.
2. **UtranExternalCell**: used to configure external UTRAN cells. If CS+PS SRVCC is enabled, you need to set the **UtranExternalCell.Rac** parameter.

3. **UtranExternalCellPlmn**: used to configure additional PLMN IDs for each shared external UTRAN cell. This MO is required only if the NodeB that serves the external UTRAN cell works in RAN sharing with common carriers mode and multiple operators share the external UTRAN cell.
4. **UtranNCell**: used to configure the neighboring relationship with a UTRAN cell.

## Scenario-specific Data

The following table describes the parameter that must be set in the **CellHoParaCfg** MO to enable SRVCC to UTRAN.

**Table 7-2** SRVCC to UTRAN switch

Parameter Name	Parameter ID	Data Source	Setting Notes
Handover Mode switch	<b>CellHoPara Cfg.HoMode Switch</b>	Network plan (negotiation not required)	To enable SRVCC to UTRAN, select the <b>UtranSrvccSwitch(UtranSrvccSwitch )</b> option of this parameter.

The following table describes the parameters that must be set in the **InterRatPolicyCfgGroup** MO to configure an inter-RAT handover policy group.

**Table 7-3** Inter-RAT handover policy group

Parameter Name	Parameter ID	Data Source	Setting Notes
InterRAT policy config group ID	<b>InterRatPolicyCfgGroup.InterRatPolicyCfgGroupId</b>	Network plan (negotiation not required)	Set this parameter to the value of the <b>StandardQci.InterRatPolicyCfgGroupId</b> parameter described in <a href="#">Table 7-4</a> .
UTRAN handover policy configuration	<b>InterRatPolicyCfgGroup.UtranHoCfg</b>	Network plan (negotiation not required)	Select the <b>SRVCC</b> option of this parameter.
No handover flag	<b>InterRatPolicyCfgGroup.NoHoFlag</b>	Network plan (negotiation not required)	It is recommended that the default value be used if there is no special requirement for forbidding certain handovers.

The following table describes the parameters that must be set in the **StandardQci** MO to configure a QCI-based inter-RAT handover policy group.

**Table 7-4** Inter-RAT handover policy group for a QCI

Parameter Name	Parameter ID	Data Source	Setting Notes
QoS Class Indication	<b>StandardQci.Qci</b>	Network plan (negotiation not required)	Set this parameter based on site conditions. For example, set this parameter to <b>QCI1(QCI 1)</b> .
InterRAT policy config group ID	<b>StandardQci.InterRatPolicyCfgGroupId</b>	Network plan (negotiation not required)	Set this parameter to the value of the <b>InterRatPolicyCfgGroup.Id</b> parameter described in <a href="#">Table 7-3</a> .

The following table describes the parameter that must be set in the **CellStandardQci** MO to configure the QCI priority used by each QCI-based handover algorithm.

**Table 7-5** QCI priority for handovers

Parameter Name	Parameter ID	Data Source	Setting Notes
QCI Priority For Handover	<b>CellStandardQci.QciPriorityForHo</b>	Network plan (negotiation not required)	It is recommended that this parameter be set to the highest priority ( <b>1</b> ).

The following table describes the parameters that must be set to configure LCS-based SRVCC. If LCS is required when a UE is performing a service with a QCI of 1 in an E-UTRAN network that supports IMS but does not support LCS, the UE needs to fall back to a CS domain to perform LCS by using an SRVCC procedure.

**Table 7-6** Parameters for LCS-based SRVCC

Parameter Name	Parameter ID	Data Source	Setting Notes
Handover Mode switch	<b>ENodeBAlgoSwitch.HoModeSwitch</b>	Network plan (negotiation not required)	Select the <b>LcsSrvccSwitch(LcsSrvccSwitch)</b> option of this parameter.
UTRAN LCS capability	<b>CSFallBackBlind-HoCfg.UtranLcsCap</b>	Network plan (negotiation not required)	Set this parameter to <b>ON(On)</b> .

The following table describes the **SRVCC handover switch based on UE capability** parameter that must be set to exempt the eNodeB from checking whether the eNodeB obtains

the SRVCC feasibility indicator when the UE initiates SRVCC and the eNodeB cannot obtain the SRVCC feasibility indicator specified by the SRVCC Operation Possible IE.

The parameter is in the **GlobalProcSwitch** MO.

**Table 7-7** SRVCC handover switch based on UE capability

Parameter Name	Parameter ID	Data Source	Setting Notes
SRVCC handover switch based on UE capability	<b>GlobalProcSwitch. ProtocolMsgOptSwitch</b>	Network plan (negotiation not required)	It is recommended that the <b>SRVCCHoBasedUeCapSwitch</b> option of the <b>GlobalProcSwitch. ProtocolMsgOptSwitch</b> parameter be selected when the UMTS-to-LTE PS HO feature is activated on the live network and UEs performing UMTS services do not report SRVCC capability information to the CN.

 **NOTE**

**SRVCCHoBasedUeCapSwitch** triggers SRVCC only based on the UE SRVCC capability. It is enabled on the premise that the CN supports SRVCC and the UE has STN-SR registration information when it is defined on the HSS.

### 7.1.5.2 Using the CME

For detailed operations, see CME-based Feature Configuration.

### 7.1.5.3 Using MML Commands

- Scenario 1: CS-only SRVCC to UTRAN

- Step 1** Add neighboring UTRAN frequencies and neighbor relationships with UTRAN cells, and set parameters for inter-RAT measurements. For details about parameter settings, see *Inter-RAT Mobility Management in Connected Mode*.
- Step 2** Run the **MOD CELLHOPARACFG** command with the **UtranSrvcSwitch(UtranSrvcSwitch)** option of the **Handover Mode switch** parameter selected.

 **NOTE**

This function is also controlled by the **UtranSrvccSwitch(UtranSrvccSwitch)** option of the eNodeB-level parameter **ENodeBAlgoSwitch.HoModeSwitch**.

If the option of the eNodeB-level parameter is selected, the option of the cell-level parameter does not take effect. If the option of the eNodeB-level parameter is cleared, the option of the cell-level parameter takes effect.

The eNodeB-level parameter will no longer be used in later versions. Therefore, you are advised to use the cell-level parameter.

- Step 3** Run the **MOD INTERRATPOLICYCFGGROUP** command with the **InterRAT policy config group ID** parameter set to **0**, with only the **SRVCC** option of the **UTRAN handover policy Configuration** parameter selected, and with the **No handover flag** parameter set to **PERMIT\_HO\_ENUM(Permit Ho)**.
- Step 4** Run the **MOD STANDARDQCI** command with the **InterRAT policy config group ID** parameter set to **0** for QCI 1.
- Step 5** Run the **MOD CELLSTANDARDQCI** command with the **QCI priority for handover** parameter specified for QCI 1 and run this command with the **QCI priority for handover** parameter specified for QCI 5. Ensure that the priority for QCI 1 is higher than that for QCI 5.
- Step 6** (Optional) Run the **MOD GLOBALPROCSWITCH** command with the **SRVCCHoBasedUeCapSwitch** option of the **Protocol Message Optimization Switch** parameter selected. The eNodeB triggers SRVCC only if the UE supports SRVCC.

**----End**

- Scenario 2: CS-and-PS SRVCC to UTRAN

- Step 1** Add neighboring UTRAN frequencies and neighbor relationships with UTRAN cells, and set parameters for inter-RAT measurements. For details about parameter settings, see *Inter-RAT Mobility Management in Connected Mode*.
- Step 2** Run the **MOD CELLHOPARACFG** command with the **UtranSrvccSwitch(UtranSrvccSwitch)** and **UtranPsHoSwitch(UtranPsHoSwitch)** options of the **Handover Mode switch** parameter selected.

 **NOTE**

In addition, this function is controlled by the **UtranSrvccSwitch(UtranSrvccSwitch)** option of the **ENodeBAlgoSwitch.HoModeSwitch** parameter.

If the option of the eNodeB-level parameter is selected, the option of the cell-level parameter does not take effect. If the option of the eNodeB-level parameter is cleared, the option of the cell-level parameter takes effect.

The eNodeB-level parameter will no longer be used in later versions. Therefore, you are advised to use the cell-level parameter.

- Step 3** Run the **MOD INTERRATPOLICYCFGROUP** command with the **InterRAT policy config group ID** parameter set to **0**, with only the **SRVCC** and **PS\_HO** options of the **UTRAN handover policy Configuration** parameter selected, and with the **No handover flag** parameter set to **PERMIT\_HO\_ENUM(Permit Ho)**.
- Step 4** Run the **MOD STANDARDQCI** command with the **InterRAT policy config group ID** parameter set to **0** for QCI 1.
- Step 5** Run the **MOD CELLSTANDARDQCI** command with the **QCI priority for handover** parameter specified for QCI 1 and run this command with the **QCI priority for handover** parameter specified for QCI 5. Ensure that the priority for QCI 1 is higher than that for QCI 5.

**Step 6** Run the **MOD CnOperatorHoCfg** command with the **SrvccWithPsBasedCellCapSw** parameter set to **OFF(Off)**. Run the **MOD UTRANEXTERNALCELL** command with the **CsPsHOInd** parameter set to **YES**.

**Step 7** (Optional) Run the **MOD GLOBALPROCSWITCH** command with the **SRVCCHoBasedUeCapSwitch** option of the **Protocol Message Optimization Switch** parameter selected. The eNodeB triggers SRVCC only if the UE supports SRVCC.

----End

- Scenario 3: LCS-based SRVCC to UTRAN. When CS-only SRVCC or CS+PS SRVCC is enabled, perform the following operations:

**Step 1** Run the **MOD ENODEBALGOSWITCH** command with the **LcsSrvccSwitch** option of the **Handover Mode switch** parameter selected.

**Step 2** Run the **MOD CSFALLBACKBLINDHOCFG** command with the **UTRAN LCS capability** parameter set to **ON(On)**.

----End

#### 7.1.5.4 MML Command Examples

- Scenario 1: CS-only SRVCC to UTRAN

```
MOD CELLHOPARACFG: LocalCellId=0, HoModeSwitch=UtranSrvccSwitch-1;
MOD INTERRATPOLICYCFGGROUP: InterRatPolicyCfgGroupId=0,
UtranHoCfg=SRVCC-1&PS_HO-0&REDIRECTION-0, NoHoFlag=PERMIT_HO_ENUM-1;
MOD STANDARDQCI: Qci=QCI1, InterRatPolicyCfgGroupId=0;
MOD CELLSTANDARDQCI: LocalCellId=0, Qci=QCI1, QciPriorityForHo=1;
MOD CELLSTANDARDQCI: LocalCellId=0, Qci=QCI5, QciPriorityForHo=9;
MOD UTRANEXTERNALCELL: Mcc="460", Mnc="20", RncId=48, CellId=12,
RacCfgInd=CFG, Rac=89,CsPsHOInd=BOOLEAN_FALSE;
(Optional) MOD GLOBALPROCSWITCH:
ProtocolMsgOptSwitch=SRVCCHoBasedUeCapSwitch-1;
```

- Scenario 2: CS-and-PS SRVCC to UTRAN

```
MOD CELLHOPARACFG:
LocalCellId=0,HoModeSwitch=UtranPsHoSwitch-1&UtranSrvccSwitch-1;
MOD INTERRATPOLICYCFGGROUP: InterRatPolicyCfgGroupId=0,
UtranHoCfg=PS_HO-1&SRVCC-1&REDIRECTION-0, NoHoFlag=PERMIT_HO_ENUM-1;
MOD STANDARDQCI: Qci=QCI1, InterRatPolicyCfgGroupId=0;
MOD CELLSTANDARDQCI: LocalCellId=0, Qci=QCI1, QciPriorityForHo=1;
MOD CELLSTANDARDQCI: LocalCellId=0, Qci=QCI5, QciPriorityForHo=9;
MOD UTRANEXTERNALCELL: Mcc="460", Mnc="20", RncId=48, CellId=12,
RacCfgInd=CFG, Rac=89,CsPsHOInd=BOOLEAN_TRUE;
(Optional) MOD GLOBALPROCSWITCH:
ProtocolMsgOptSwitch=SRVCCHoBasedUeCapSwitch-1;
```

- Scenario 3: LCS-based SRVCC to UTRAN

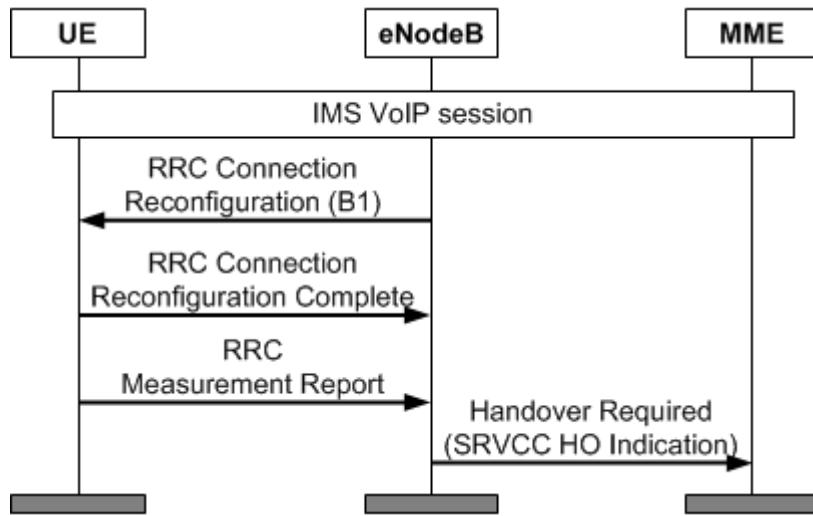

```
MOD ENODEBALGOSWITCH: HoModeSwitch=LcsSrvccSwitch-1;
MOD CSFALLBACKBLINDHOCFG: UtranLcsCap=ON;
```

#### 7.1.6 Activation Observation

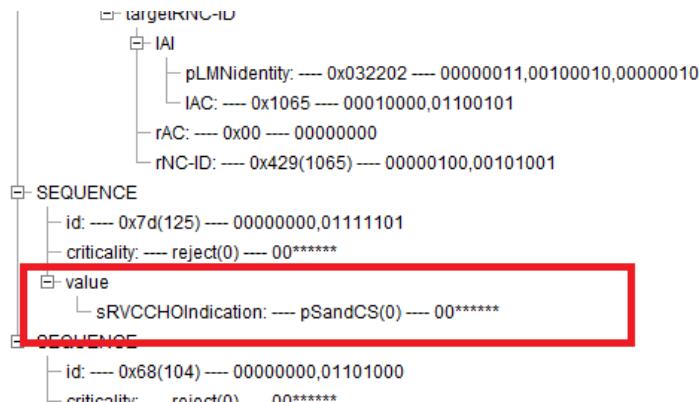

##### Tracing Signaling Messages of a Single UE

Perform standard S1 interface tracing for a single UE. If the traced Handover Required message, as shown in [Figure 7-1](#), contains the SRVCC HO Indication IE, SRVCC to UTRAN has been activated.

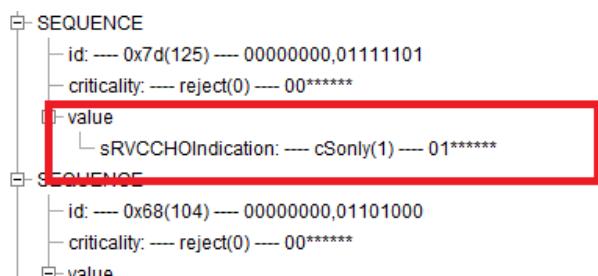

**Figure 7-1** SRVCC HO Indication IE contained in the Handover Required message

**Figure 7-2** CS-and-PS SRVCC signaling tracing

**Figure 7-3** CS-only SRVCC signaling tracing

## Performance Counter

Observe the counters described in **Table 7-8**. If the value of a counter is not 0, the related feature or function has been activated.

**Table 7-8** SRVCC-related counters

Feature/Function	Counter ID	Counter Name	Counter Description
SRVCC to UTRAN	1526728400	<b>L.IRATHO.SRVC.C.E2W.PrepAttOut</b>	Number of EUTRAN-to-WCDMA handover attempts for SRVCC
SRVCC to UTRAN	1526728401	<b>L.IRATHO.SRVC.C.E2W.ExecAttOut</b>	Number of SRVCC-based outgoing handover executions from E-UTRAN to WCDMA network for ultra-flash CSFB
SRVCC to UTRAN	1526728402	<b>L.IRATHO.SRVC.C.E2W.ExecSuccOut</b>	Number of successful EUTRAN-to-WCDMA handovers for SRVCC

## 7.1.7 Deactivation

**Table 7-9** provides the parameter used to deactivate this feature.

**Table 7-9** Parameters for SRVCC to UTRAN

MO	Parameter Group	Setting Notes
CellAlgoSwitch	HoModeSwitch	Set <b>UtranSrvccSwitch</b> under the <b>HoModeSwitch</b> parameter to <b>0</b> .

This feature can be deactivated using the CME or MML commands.

### 7.1.7.1 Using the CME

For detailed operations, see CME-based Feature Configuration.

### 7.1.7.2 Using MML Commands

Run the **MOD CELLALGOSWITCH** command with the **UtranSrvccSwitch(UtranSrvccSwitch)** option of the **Handover Mode switch** parameter cleared.

### 7.1.7.3 MML Command Examples

```
MOD CELLALGOSWITCH: LocalCellId=0, HoModeSwitch=UtranSrvccSwitch-0;
```

## 7.1.8 Performance Monitoring

**Table 7-10** lists the performance counters for monitoring SRVCC to UTRAN. For the voice interruption delay and PS service interruption delay, you need to obtain and analyze logs on the UE side.

**Table 7-10** Performance counters for monitoring SRVCC to UTRAN

Counter ID	Counter Name	Description
1526728400	<b>L.IRATHO.SRVCC.E2W.PrepAttOut</b>	Number of EUTRAN-to-WCDMA handover attempts for SRVCC
1526728401	<b>L.IRATHO.SRVCC.E2W.ExecAttOut</b>	Number of EUTRAN-to-WCDMA handover executions for SRVCC
1526728402	<b>L.IRATHO.SRVCC.E2W.ExecSuccOut</b>	Number of successful EUTRAN-to-WCDMA handovers for SRVCC
1526728406	<b>L.IRATHO.SRVCC.E2T.PrePAttOut</b>	Number of EUTRAN-to-TDSCDMA handover attempts for SRVCC
1526728407	<b>L.IRATHO.SRVCC.E2T.ExecAttOut</b>	Number of EUTRAN-to-TDSCDMA handover executions for SRVCC
1526728408	<b>L.IRATHO.SRVCC.E2T.ExecSuccOut</b>	Number of successful EUTRAN-to-TDSCDMA handovers for SRVCC
1526728894	<b>L.IRATHO.SRVCC.E2W.MMEAAbnormRsp</b>	Number of responses for abnormal causes received by the eNodeB from the MME during inter-RAT handover executions from E-UTRAN to WCDMA network for SRVCC
1526728896	<b>L.IRATHO.SRVCC.E2T.MMEAAbnormRsp</b>	Number of responses for abnormal causes received by the eNodeB from the MME during inter-RAT handover executions from E-UTRAN to TD-SCDMA network for SRVCC

**Table 7-11** lists the performance counters for monitoring LCS-based SRVCC when UEs are running services with QCI 1.

**Table 7-11** Performance counters for monitoring LCS-based SRVCC

Counter ID	Counter Name	Description
1526728409	<b>L.CSFBLCS.PrepAtt</b>	Number of LCS-triggered CS fallback indicators received by the eNodeB

Counter ID	Counter Name	Description
1526728410	<b>L.CSFB.LCS.PrepSucc</b>	Number of responses sent from the eNodeB to MMEs for CSFB triggered by LCS
1526728753	<b>L.IRATHO.SRVCC.LCS.E2W.PrepAttOut</b>	Number of LCS-based EUTRAN-to-WCDMA handover attempts for SRVCC
1526728754	<b>L.IRATHO.SRVCC.LCS.E2W.ExecAttOut</b>	Number of LCS-based EUTRAN-to-WCDMA handover executions for SRVCC
1526728755	<b>L.IRATHO.SRVCC.LCS.E2W.ExecSuccOut</b>	Number of successful LCS-based EUTRAN-to-WCDMA handovers for SRVCC
1526728759	<b>L.IRATHO.SRVCC.LCS.E2T.PrepAttOut</b>	Number of LCS-based EUTRAN-to-TDSCDMA handover attempts for SRVCC
1526728760	<b>L.IRATHO.SRVCC.LCS.E2T.ExecAttOut</b>	Number of LCS-based EUTRAN-to-TDSCDMA handover executions for SRVCC
1526728761	<b>L.IRATHO.SRVCC.LCS.E2T.ExecSuccOut</b>	Number of successful LCS-based EUTRAN-to-TDSCDMA handovers for SRVCC

**Table 7-12** lists the performance counters for monitoring SRVCC triggered for emergency calls.

**Table 7-12** Performance counters for monitoring SRVCC triggered for emergency calls

Counter ID	Counter Name	Description
1526729517	<b>L.EMC.SRVCC.E2W.PrepAttOut</b>	Number of EUTRAN-to-WCDMA handover attempts for SRVCC triggered for emergency calls
1526729518	<b>L.EMC.SRVCC.E2W.ExecAttOut</b>	Number of EUTRAN-to-WCDMA handover executions for SRVCC triggered for emergency calls
1526729519	<b>L.EMC.SRVCC.E2W.ExecSuccOut</b>	Number of successful EUTRAN-to-WCDMA handovers for SRVCC triggered for emergency calls

Counter ID	Counter Name	Description
1526729523	<b>L.EMC.SRVCC.E2T.PreAttOut</b>	Number of EUTRAN-to-TDSCDMA handover attempts for SRVCC triggered for emergency calls
1526729524	<b>L.EMC.SRVCC.E2T.ExecAttOut</b>	Number of EUTRAN-to-TDSCDMA handover executions for SRVCC triggered for emergency calls
1526729525	<b>L.EMC.SRVCC.E2T.ExecSuccOut</b>	Number of successful EUTRAN-to-TDSCDMA handovers for SRVCC triggered for emergency calls

Calculate SRVCC preparation and execution success rates. If the results do not meet the SRVCC performance requirements of an operator, fault isolation and diagnosis are required. Take monitoring the performance of SRVCC to UTRAN as an example. The formulas for calculating other success rates are similar to the following:

- $(L.IRATHO.SRVCC.E2W.ExecSuccOut - L.IRATHO.SRVCC.E2W.MMEAAbnormRsp) / L.IRATHO.SRVCC.E2W.ExecAttOut$
- $L.IRATHO.SRVCC.E2W.ExecAttOut / L.IRATHO.SRVCC.E2W.PrepAttOut$

## 7.1.9 Parameter Optimization

Different event A2 or B1 thresholds for VoIP and other services can be set to achieve flexible control.

The following table lists threshold parameters:

Event A2 Threshold	Event B1 Threshold
<b>InterRatHoCommGroup.InterRatHoA2ThdRsrp</b>	<b>InterRatHoUtranGroup.InterRatHoUtranB1ThdEcn0</b>
<b>InterRatHoCommGroup.InterRatHoA2ThdRsrq</b>	<b>InterRatHoUtranGroup.InterRatHoUtranB1ThdRscp</b>

A larger event A2 threshold indicates a higher probability of triggering SRVCC, improving the SRVCC handover success rate and decreasing the call drop rate. A smaller value results in the opposite effects.

A larger event B1 threshold indicates a lower probability of triggering SRVCC to UTRAN, improving the handover success rate and increasing the call drop rate. A smaller value results in the opposite effects.

## 7.2 TDLOFD-001023 SRVCC to GERAN

### 7.2.1 When to Use SRVCC to GERAN

Use SRVCC to GERAN if the operator provides IMS-based VoLTE services in an E-UTRAN network and voice services in a legacy GERAN CS network and while E-UTRANs are not fully deployed across the operator's coverage areas.

For details about when to use VoLTE, see *VoLTE Feature Parameter Description*.

### 7.2.2 Required Information

1. Operating frequencies, coverage areas, and configurations of E-UTRAN and GERAN cells.
2. Versions and configurations of the NEs in the E-UTRAN, GERAN, and core networks. Ensure that they all support SRVCC.
3. Operating frequency bands, supported measurement events, and SRVCC capabilities of GSM+LTE UEs on live networks.

### 7.2.3 Process

To deploy SRVCC to GERAN, you must complete the following steps:

- Formulate a neighboring cell plan and configure the neighboring cells accordingly when both GSM and LTE networks are deployed.
- Configure parameters of handover thresholds related to SRVCC to GERAN.
- Prepare the license file related to SRVCC to GERAN and configure algorithm switches related to SRVCC to GERAN.

### 7.2.4 Requirements

#### Operating Environment

- For the Huawei EPC, the EPC version for eRAN6.0 is required. If the EPC version is not for eRAN6.0, messages may not be parsed.
- For a third party's EPC, SRVCC complying with 3GPP Release 8 must be supported. Check that software versions for the EPC are correct.

#### License

The operator has purchased and activated the license for the feature listed in the following table.

**Table 7-13** License control item for SRVCC to GERAN

Feature ID	Feature Name	Model	License Control Item	NE	Sales Unit
TDLOFD-001023	SRVCC to GERAN	LT1STRV CCG00	SRVCC to GERAN (TDD)	eNodeB	Number of RRC Connected Users

## 7.2.5 Data Preparation and Feature Activation

### 7.2.5.1 Data Preparation

This section describes the data that you need to collect for setting parameters. Required data is data that you must collect for all scenarios. Collect scenario-specific data when necessary for a specific feature deployment scenario.

There are three types of data sources:

- Network plan (negotiation not required): parameter values planned and set by the operator
- Network plan (negotiation required): parameter values planned by the operator and negotiated with the EPC or peer transmission equipment
- User-defined: parameter values set by users

### Required Data

Before configuring SRVCC to GERAN, collect the data related to neighbor relationships with GERAN cells. This section provides only the information about MOs related to neighboring GERAN cells. For more information about how to collect data for the parameters in these MOs, see *Inter-RAT Mobility Management in Connected Mode Feature Parameter Description*. Collect data for the parameters in the following MOs:

1. Collect data for the parameters in the following MOs: **GeranNfreqGroup**: used to configure GERAN carrier frequency groups.
2. **GeranNfreqGroupArfcn**: used to configure absolute radio frequency channel numbers (ARFCNs) in each GERAN carrier frequency group.
3. **GeranExternalCell**: used to configure external GERAN cells. If CS+PS SRVCC is enabled, you need to set the **GeranExternalCell.Rac** and **GeranExternalCell.CsPsHOInd** parameters.
4. (Optional) **GeranExternalCellPlmn**: used to configure additional PLMN IDs for each shared external GERAN cell. This MO is required only if the BTS that serves the external GERAN cell works in RAN sharing with common carriers mode and multiple operators share the external GERAN cell.
5. **GeranNcell**: used to configure neighbor relationships with GERAN cells.

### Scenario-specific Data

The following table describes the parameter that must be set in the **CellHoParaCfg** MO to enable SRVCC to GERAN.

**Table 7-14** SRVCC to GERAN switch

Parameter Name	Parameter ID	Data Source	Setting Notes
Handover Mode switch	<b>CellHoPara Cfg.HoMode Switch</b>	Network plan (negotiation not required)	To enable SRVCC to GERAN, select the <b>GeranSrvccSwitch(GeranSrvccSwitch)</b> option of this parameter.

The following table describes the parameters that must be set in the **InterRatPolicyCfgGroup** MO to configure an inter-RAT handover policy group.

**Table 7-15** Inter-RAT handover policy group

Parameter Name	Parameter ID	Data Source	Setting Notes
InterRAT policy config group ID	<b>InterRatPolicyCfgGroup.InterRatPolicyCfgGroupId</b>	Network plan (negotiation not required)	Set this parameter to the value of the <b>StandardQci.InterRatPolicyCfgGroupId</b> parameter described in <a href="#">Table 7-16</a> .
GERAN GSM handover policy Configuration	<b>InterRatPolicyCfgGroup.GeranGsmHoCfg</b>	Network plan (negotiation not required)	Select the <b>SRVCC</b> option of this parameter.
GERAN GPRS EDGE handover policy Configuration	<b>InterRatPolicyCfgGroup.GeranGprsEdgeHoCfg</b>	Network plan (negotiation not required)	Select the <b>SRVCC</b> option of this parameter.
No handover flag	<b>InterRatPolicyCfgGroup.NoHoFlag</b>	Network plan (negotiation not required)	It is recommended that the default value be used if there is no special requirement for forbidding certain handovers.

The following table describes the parameters that must be set in the **StandardQci** MO to configure a QCI-based inter-RAT handover policy group.

**Table 7-16** Inter-RAT handover policy group for a QCI

Parameter Name	Parameter ID	Data Source	Setting Notes
QoS Class Indication	<b>StandardQci.Qci</b>	Network plan (negotiation not required)	Set this parameter based on site conditions. For example, set this parameter to <b>QCI1(QCI 1)</b> .

Parameter Name	Parameter ID	Data Source	Setting Notes
InterRAT policy config group ID	<b>StandardQci.InterRatPolicyCfgGroupId</b>	Network plan (negotiation not required)	Set this parameter to the value of the <b>InterRatPolicyCfgGroup.Id</b> parameter described in <a href="#">Table 7-15</a> .

The following table describes the parameter that must be set in the **CellStandardQci** MO to configure the QCI priority used by each QCI-based handover algorithm.

**Table 7-17** QCI priority for handovers

Parameter Name	Parameter ID	Data Source	Setting Notes
QCI Priority For Handover	<b>CellStandardQci.QciPriorityForHo</b>	Network plan (negotiation not required)	It is recommended that this parameter be set to the highest priority (1).

The following table describes the parameters that must be set to configure LCS-based SRVCC. If LCS is required when a UE is performing a service with a QCI of 1 in an E-UTRAN network that supports IMS but does not support LCS, the UE needs to fall back to a CS domain to perform LCS by using an SRVCC procedure.

**Table 7-18** Parameters for LCS-based SRVCC

Parameter Name	Parameter ID	Data Source	Setting Notes
Handover Mode switch	<b>ENodeBAlgoSwitch.HoModeSwitch</b>	Network plan (negotiation not required)	Select the <b>LcsSrvccSwitch(LcsSrvccSwitch)</b> option of this parameter.
GERAN LCS capability	<b>CSFallbackBlind-HoCfg.GeranLcsCap</b>	Network plan (negotiation not required)	Set this parameter to <b>ON(On)</b> .

The following table describes the parameter that must be set in the **CellAlgoSwitch** MO to select the **GSM\_MEAS\_DEL\_INTERFREQ\_SW** option.

Parameter Name	Parameter ID	Data Source	Setting Notes
Measurement Optimization Algorithm Switch	<b>CellAlgoSwitch.Me asOptAlgoSwitch</b>	Network plan (negotiation not required)	Select the <b>GSM_MEAS_DEL_INTERFREQ_SW</b> option.

The following table describes the **SRVCC handover switch based on UE capability** parameter that must be set to exempt the eNodeB from checking whether the eNodeB obtains the SRVCC feasibility indicator when the UE initiates SRVCC and the eNodeB cannot obtain the SRVCC feasibility indicator specified by the SRVCC Operation Possible IE.

The parameter is in the **GlobalProcSwitch** MO.

**Table 7-19** SRVCC handover switch based on UE capability

Parameter Name	Parameter ID	Data Source	Setting Notes
SRVCC handover switch based on UE capability	<b>GlobalProcSwitch.ProtocolMsgOptSwitch</b>	Network plan (negotiation not required)	It is recommended that the <b>SRVCCHoBasedUeCapSwitch</b> option of the <b>GlobalProcSwitch.ProtocolMsgOptSwitch</b> parameter be selected when the GSM-to-LTE PS HO feature is activated on the live network and UEs performing UMTS services do not report SRVCC capability information to the CN.

#### NOTE

**SRVCCHoBasedUeCapSwitch** triggers SRVCC only based on the UE SRVCC capability. It is enabled on the premise that the CN supports SRVCC and the UE has STN-SR registration information when it is defined on the HSS.

#### 7.2.5.2 Using the CME

For detailed operations, see CME-based Feature Configuration.

#### 7.2.5.3 Using MML Commands

- Scenario 1: CS-only SRVCC to GERAN

**Step 1** Add neighboring GERAN frequencies and neighbor relationships with GERAN cells, and set parameters for inter-RAT measurements. For details about parameter settings, see *Inter-RAT Mobility Management in Connected Mode*.

**Step 2** Run the **MOD CELLALGOSWITCH** command with the **GeranSrvccSwitch(GeranSrvccSwitch)** option of the **Handover Mode switch** parameter selected.

 **NOTE**

In addition, this function is controlled by the **GeranSrvccSwitch(GeranSrvccSwitch)** option of the **ENodeBAlgoSwitch.HoModeSwitch** parameter.

If the option of the eNodeB-level parameter is selected, the option of the cell-level parameter does not take effect. If the option of the eNodeB-level parameter is cleared, the option of the cell-level parameter takes effect.

The eNodeB-level parameter will no longer be used in later versions. Therefore, you are advised to use the cell-level parameter.

**Step 3** Run the **MOD INTERRATPOLICYCFGGROUP** command with the **InterRAT policy config group ID** parameter set to **0**, with the **SRVCC** option of the **GERAN GSM handover policy Configuration** parameter selected, with only the **SRVCC** option of the **GERAN GPRS EDGE handover policy Configuration** parameter selected, and with the **No handover flag** parameter set to **PERMIT\_HO\_ENUM(Permit Ho)**.

**Step 4** Run the **MOD STANDARDQCI** command with the **InterRAT policy config group ID** parameter set to **0** for QCI 1.

**Step 5** Run the **MOD CELLSTANDARDQCI** command with the **QCI priority for handover** parameter specified for QCI 1 and QCI 5. Ensure that the priority for QCI 1 is higher than that for QCI 5.

**Step 6** (Optional) Run the **MOD GlobalProcSwitch** command with the **IratMeasCfgTransSwitch** option of the **Protocol Message Optimization Switch** parameter selected for fast return from GERAN to E-UTRAN after SRVCC to take effect.

**Step 7** (Optional) Run the **MOD GLOBALPROCSWITCH** command with the **SRVCCHoBasedUeCapSwitch** option of the **Protocol Message Optimization Switch** parameter selected. The eNodeB triggers SRVCC only if the UE supports SRVCC.

**Step 8** (Optional and required when some operators or neighboring GERAN cells do not support SRVCC to GERAN) Run the **ADD GERANNETWORKCAPCFG** command with the **SrvccCapCfg** option of the **NetworkCapCfg** parameter cleared and with the **Mcc**, **Mnc**, and **Lac** parameters set.

**Step 9** (Optional) Run the **MOD CELLALGOSWITCH** command with the **GeranSepOpMobilitySwitch(GeranSepOpMobilitySwitch)** option of the **Handover Allowed Switch** parameter selected.

----End

- Scenario 2: CS+PS SRVCC to GERAN

**Step 1** Add neighboring GERAN frequencies and neighbor relationships with GERAN cells, and set parameters for inter-RAT measurements. For details about parameter settings, see *Inter-RAT Mobility Management in Connected Mode*.

**Step 2** Run the **MOD CELLHOPARACFG** command with the **UtranSrvccSwitch(UtranSrvccSwitch)** and **UtranPsHoSwitch(UtranPsHoSwitch)** options of the **Handover Mode switch** parameter selected.

 **NOTE**

In addition, this function is controlled by the **GeranSrvccSwitch(GeranSrvccSwitch)** option of the **ENodeBAlgoSwitch.HoModeSwitch** parameter.

If the option of the eNodeB-level parameter is selected, the option of the cell-level parameter does not take effect. If the option of the eNodeB-level parameter is cleared, the option of the cell-level parameter takes effect.

The eNodeB-level parameter will no longer be used in later versions. Therefore, you are advised to use the cell-level parameter.

- Step 3** Run the **MOD ENODEBALGOSWITCH** command with the **GeranPsHoSwitch(GeranPsHoSwitch)** option of the **Handover Mode switch** parameter selected.
- Step 4** Run the **MOD INTERRATPOLICYCFGGROUP** command with the **InterRAT policy config group ID** parameter set to **0**, with the **SRVCC** option of the **GERAN GSM handover policy Configuration** parameter selected, with only the **SRVCC** and **PS\_HO** options of the **GERAN GPRS EDGE handover policy Configuration** parameter selected, and with the **No handover flag** parameter set to **PERMIT\_HO\_ENUM(Permit Ho)**.
- Step 5** Run the **MOD STANDARDQCI** command with the **InterRAT policy config group ID** parameter set to **0** for QCI 1.
- Step 6** Run the **MOD CELLSTANDARDQCI** command with the **QCI priority for handover** parameter specified for QCI 1 and QCI 5. Ensure that the priority for QCI 1 is higher than that for QCI 5.
- Step 7** Run the **MOD GERANEXTERNALCELL** command with the **CS and PS handover indicator** parameter set to **BOOLEAN\_TRUE(True)**.
- Step 8** (Optional) Run the **MOD GlobalProcSwitch** command with the **IratMeasCfgTransSwitch** option of the **Protocol Message Optimization Switch** parameter selected for fast return from GERAN to E-UTRAN after SRVCC to take effect.
- Step 9** (Optional) Run the **MOD GLOBALPROCSWITCH** command with the **SRVCCHoBasedUeCapSwitch** option of the **Protocol Message Optimization Switch** parameter selected. The eNodeB triggers SRVCC only if the UE supports SRVCC.
- Step 10** (Optional and required when some operators or neighboring GERAN cells do not support SRVCC to GERAN) Run the **ADD GERANNETWORKCAPCFG** command with the **SrvccCapCfg** option of the **NetworkCapCfg** parameter cleared and with the **Mcc**, **Mnc**, and **Lac** parameters set.
- Step 11** (Optional) Run the **MOD CELLALGOSWITCH** command with the **GeranSepOpMobilitySwitch(GeranSepOpMobilitySwitch)** option of the **Handover Allowed Switch** parameter selected.

----End

- Scenario 3: LCS-based SRVCC to GERAN

- Step 1** Run the **MOD ENODEBALGOSWITCH** command with the **LcsSrvccSwitch** option of the **Handover Mode switch** parameter selected.
- Step 2** Run the **MOD CSFALLBACKBLINDHOCFG** command with the **GERAN LCS capability** parameter set to **ON(On)**.
- Step 3** (Optional and required when some operators or neighboring GERAN cells do not support SRVCC to GERAN) Run the **ADD GERANNETWORKCAPCFG** command with the

**SrvccCapCfg** option of the **NetworkCapCfg** parameter cleared and with the **Mcc**, **Mnc**, and **Lac** parameters set.

- Step 4** (Optional) Run the **MOD CELLALGOSWITCH** command with the **GeranSepOpMobilitySwitch(GeranSepOpMobilitySwitch)** option of the **Handover Allowed Switch** parameter selected.

----End

#### 7.2.5.4 MML Command Examples

- Scenario 1: CS-only SRVCC to GERAN

```
MOD CELLALGOSWITCH: LocalCellId=0, HoModeSwitch=GeranSrvccSwitch-1;
MOD INTERRATPOLICYCFGGROUP: InterRatPolicyCfgGroupId=0,
GeranGsmHoCfg=SRVCC-1, GeranGprsEdgeHoCfg=SRVCC-1&PS_HO-0&REDIRECTION-0,
NoHoFlag=PERMIT_HO_ENUM-1;
MOD STANDARDQCI: Qci=QCI1, InterRatPolicyCfgGroupId=0;
MOD CELLSTANDARDQCI: LOCALCELLID=0, QCI=QCI1, QCIPRIORITYFORHO=1;
MOD CELLSTANDARDQCI: LOCALCELLID=0, QCI=QCI5, QCIPRIORITYFORHO=9;
MOD GERANEXTERNALCELL: Mcc="460", Mnc="20", GeranCellId=15, Lac=12,
RacCfgInd=NOT_CFG, BandIndicator=GSM_dcs1800,CsPsHOInd=BOOLEAN_FALSE;
MOD GlobalProcSwitch: ProtocolMsgOptSwitch=IratMeasCfgTransSwitch-1;
(Optional) MOD GLOBALPROCSWITCH:
ProtocolMsgOptSwitch=SRVCCHOBasedUeCapSwitch-1;
```

- Scenario 2: CS+PS SRVCC to GERAN

```
MOD CELLALGOSWITCH: LocalCellId=0, HoModeSwitch=GeranSrvccSwitch-1;
MOD ENODEBALGOSWITCH: HoModeSwitch=GeranPsHoSwitch-1;
MOD INTERRATPOLICYCFGGROUP: InterRatPolicyCfgGroupId=0,
GeranGsmHoCfg=SRVCC-1, GeranGprsEdgeHoCfg=PS_HO-1&SRVCC-1&REDIRECTION-0,
NoHoFlag=PERMIT_HO_ENUM-1;
MOD STANDARDQCI: Qci=QCI1, InterRatPolicyCfgGroupId=0;
MOD CELLSTANDARDQCI: LOCALCELLID=0, QCI=QCI1, QCIPRIORITYFORHO=1;
MOD CELLSTANDARDQCI: LOCALCELLID=0, QCI=QCI5, QCIPRIORITYFORHO=9;
MOD GERANEXTERNALCELL: Mcc="460", Mnc="20", GeranCellId=15, Lac=12,
RacCfgInd=CFG, BandIndicator=GSM_dcs1800,CsPsHOInd=BOOLEAN_TRUE;
MOD GlobalProcSwitch: ProtocolMsgOptSwitch=IratMeasCfgTransSwitch-1;
(Optional) MOD GLOBALPROCSWITCH:
ProtocolMsgOptSwitch=SRVCCHOBasedUeCapSwitch-1;
```

- Scenario 3: LCS-based SRVCC to GERAN

```
MOD ENODEBALGOSWITCH: HoModeSwitch=LcsSrvccSwitch-1;
MOD CSFALLBACKBLINDHOCFG: GeranLcsCap=ON;
```

#### 7.2.6 Activation Observation

You can observe feature activation by tracing the signaling messages of a single UE and observing performance counters. Tracing the signaling messages of a single UE for SRVCC to GERAN is the same as that for SRVCC to UTRAN. For details, see [7.1.6 Activation Observation](#).

Observe the counters described in [Table 7-20](#). If the value of a counter is not 0, the related feature or function has been activated.

**Table 7-20** Mapping between counters and features/functions

Feature/Function	Counter ID	Counter Name	Counter Description
SRVCC to GERAN	1526728403	<b>L.IRATHO.SRVC.C.E2G.PrepAttOut</b>	Number of inter-RAT handover attempts from E-UTRAN to GERAN for SRVCC
CS-only SRVCC	1526730097	<b>L.IRATHO.SRVC.C.CSonly.E2G.Pre pAttOut</b>	Number of CS-only SRVCC-based outgoing handover attempts from E-UTRAN to GERAN

## 7.2.7 Deactivation

**Table 7-21** provides the parameter used to deactivate this feature.

**Table 7-21** Parameters for SRVCC to GERAN

MO	Sheet in the Summary Data File	Parameter Group	Remarks
CellAlgoSwitch	User-defined sheet. <b>CellAlgoSwitch</b> is recommended.	HoModeSwitch	Set <b>GeranSrvccSwitch</b> under the <b>HoModeSwitch</b> parameter to <b>0</b> .

This feature can be deactivated using the CME or MML commands.

### 7.2.7.1 Using the CME

For detailed operations, see CME-based Feature Configuration.

### 7.2.7.2 Using MML Commands

Run the **MOD CELLALGOSWITCH** command with the **GeranSrvccSwitch(GeranSrvccSwitch)** option of the **Handover Mode switch** parameter cleared.

### 7.2.7.3 MML Command Examples

```
MOD CELLALGOSWITCH: LocalCellId=0, HoModeSwitch=GeranSrvccSwitch-0;
```

## 7.2.8 Performance Monitoring

**Table 7-22** lists the performance counters for monitoring SRVCC to GERAN.

**Table 7-22** Performance counters for monitoring SRVCC to GERAN

Counter ID	Counter Name	Description
1526728403	<b>L.IRATHO.SRVCC.E2G.P.repAttOut</b>	Number of inter-RAT handover attempts from E-UTRAN to GERAN for SRVCC
1526728404	<b>L.IRATHO.SRVCC.E2G.ExecAttOut</b>	Number of inter-RAT handover executions from E-UTRAN to GERAN for SRVCC
1526728405	<b>L.IRATHO.SRVCC.E2G.ExecSuccOut</b>	Number of successful inter-RAT handovers from E-UTRAN to GERAN for SRVCC
1526728895	<b>L.IRATHO.SRVCC.E2G.MMEAAbnormRsp</b>	Number of responses for abnormal causes received by the eNodeB from the MME during inter-RAT handover executions from E-UTRAN to GERAN for SRVCC

**Table 7-23** lists the performance counters for monitoring LCS-based SRVCC when UEs are performing services with a QCI of 1.

**Table 7-23** Performance counters for monitoring LCS-based SRVCC

Counter ID	Counter Name	Description
1526728409	<b>L.CSFB.LCS.PrepAtt</b>	Number of LCS-triggered CS fallback indicators received by the eNodeB
1526728410	<b>L.CSFB.LCS.PrepSucc</b>	Number of responses sent from the eNodeB to MMEs for CSFB triggered by LCS
1526728756	<b>L.IRATHO.SRVCC.LCS.E2G.PrepAttOut</b>	Number of CSFB-based handover attempts from E-UTRAN to GERAN for SRVCC
1526728757	<b>L.IRATHO.SRVCC.LCS.E2G.ExecAttOut</b>	Number of CSFB-based handover executions from E-UTRAN to GERAN for SRVCC
1526728758	<b>L.IRATHO.SRVCC.LCS.E2G.ExecSuccOut</b>	Number of successful CSFB-based handovers from E-UTRAN to GERAN for SRVCC

**Table 7-24** lists the performance counters for monitoring SRVCC triggered for emergency calls.

**Table 7-24** Performance counters for monitoring SRVCC triggered for emergency calls

Counter ID	Counter Name	Description
1526729520	<b>L.EMC.SRVCC.E2G.PrepAttOut</b>	Number of handover attempts from E-UTRAN to GERAN for SRVCC triggered for emergency calls
1526729521	<b>L.EMC.SRVCC.E2G.ExecAttOut</b>	Number of handover executions from E-UTRAN to GERAN for SRVCC triggered for emergency calls
1526729522	<b>L.EMC.SRVCC.E2G.ExecSuccOut</b>	Number of successful handovers from E-UTRAN to GERAN for SRVCC triggered for emergency calls

Calculate SRVCC preparation and execution success rates. If the results do not meet the SRVCC performance requirements of an operator, perform fault isolation and diagnosis. The formulas for calculating other success rates are similar to the following:

- $(L.IRATHO.SRVCC.E2G.ExecSuccOut - L.IRATHO.SRVCC.E2G.MMEAAbnormRsp) / L.IRATHO.SRVCC.E2G.ExecAttOut$
- $L.IRATHO.SRVCC.E2G.ExecAttOut / L.IRATHO.SRVCC.E2G.PrepAttOut$

## 7.2.9 Parameter Optimization

If the E-UTRAN and UE support SRVCC to UTRAN and SRVCC to GERAN, the eNodeB will deliver both UTRAN and GERAN neighboring cell measurement configuration to the UE. The eNodeB uses the first cell in the MR reported by the UE to perform SRVCC. To enable preferential SRVCC to a specified RAT, you can set the **CnOperatorHoCfg.UtranA2ThdRsrpOffset** and **CnOperatorHoCfg.GeranA2ThdRsrpOffset** parameters for the UE to preferentially report event A2 of the UTRAN or GERAN.

## 7.3 Troubleshooting

### 7.3.1 Fault 1

#### Fault Description

The performance monitoring results show that the SRVCC handover preparation success rate does not meet the operator requirement.

- The number of handover execution attempts for SRVCC: includes the number of SRVCC-based outgoing handover executions from E-UTRAN to WCDMA, number of SRVCC-based outgoing CS-only handover executions from E-UTRAN to TD-SCDMA, and number of SRVCC-based outgoing handover executions from E-UTRAN to GERAN.

- The number of handover preparation attempts for SRVCC: includes the number of SRVCC-based outgoing handover attempts from E-UTRAN to WCDMA, number of SRVCC-based outgoing CS-only handover attempts from E-UTRAN to TD-SCDMA, and number of SRVCC-based outgoing handover attempts from E-UTRAN to GERAN.

## Fault Handling

Use performance counters to identify the cause of the fault. Counters for diagnosing faults in SRVCC to GERAN or TD-SCDMA networks are similar to those for diagnosing faults in SRVCC to WCDMA networks. The following is the procedure for diagnosing faults in SRVCC to WCDMA networks:

- Step 1** Collect the statistics of the performance counters listed in the following table to identify the fault cause.

Counter ID	Counter Name	Description
1526730082	<b>L.IRATHO.E2W.SRVCC.Pre p.FailOut.MME</b>	Number of SRVCC-based outgoing handover preparation failures from E-UTRAN to WCDMA network because of the MME side causes
1526730083	<b>L.IRATHO.E2W.SRVCC.Pre p.FailOut.PrepFailure</b>	Number of SRVCC-based outgoing handover preparation failures from E-UTRAN to WCDMA network because of the response of handover preparation failure from WCDMA network
1526730084	<b>L.IRATHO.E2W.SRVCC.Pre p.FailOut.NoReply</b>	Number of SRVCC-based outgoing handover preparation failures from E-UTRAN to WCDMA network because of no response from WCDMA network

- Step 2** Rectify the fault based on the cause.

For example, if a counter indicates that the number of SRVCC-based outgoing handover preparation failures from E-UTRAN to WCDMA increases because of core network reasons, you can locate the causes from the MME side. You can check whether the MME supports SRVCC, features related to SRVCC-based handovers are activated, or the license supports these features, and then further trace S1 signaling logs or CHRs to view detailed failure cause values.

----End

### 7.3.2 Fault 2

#### Fault Description

The performance monitoring results show that the SRVCC handover success rate does not meet the operator requirement. The SRVCC handover success rate is calculated according to the following formula: SRVCC handover success rate = (Number of successful inter-RAT

handovers for SRVCC - Number of responses for abnormal causes received by the eNodeB from the MME during inter-RAT handover executions for SRVCC)/Number of SRVCC-based outgoing handover executions for ultra-flash CSFB.

- The number of successful handover executions for SRVCC: includes the number of successful SRVCC-based outgoing handovers from E-UTRAN to WCDMA, number of successful SRVCC-based outgoing CS-only handovers from E-UTRAN to TD-SCDMA, and number of successful SRVCC-based outgoing handovers from E-UTRAN to GERAN.
- The number of handover execution attempts for SRVCC: includes the number of SRVCC-based outgoing handover executions from E-UTRAN to WCDMA, number of SRVCC-based outgoing CS-only handover executions from E-UTRAN to TD-SCDMA, and number of SRVCC-based outgoing handover executions from E-UTRAN to GERAN.

## Fault Handling

**Step 1** In the target system of handovers, check the counters related to incoming inter-RAT handovers to find out whether the UEs accessed the target system.

If the UEs accessed the target network, go to **Step 2**.

**Step 2** Check the counters related to failed inter-RAT handovers in the target system to identify whether the fault resides in the peer RAN or core network.

For details about the counters in the target system, see section "Monitoring" in *Interoperability Between UMTS and LTE Feature Parameter Description* and section "Performance Counters" in *Interoperability Between GSM and LTE Feature Parameter Description*. You can locate the failure scope based on related traffic statistics changes and check related signaling logs or CHRs to view detailed failure cause values.

----End

# 8 Parameters

**Table 8-1** Parameters

MO	Parameter ID	MML Command	Feature ID	Feature Name	Description
CellHoP araCfg	HoMode Switch	MOD CELLH OPARA CFG  LST CELLH OPARA CFG	LOFD-0 01022 / TDLOF D-00102  2  LOFD-0 01023 / TDLOF D-00102  3  LOFD-0 01033 / TDLOF D-00103  3  LOFD-0 01034 / TDLOF D-00103  4  LOFD-0 01019 / TDLOF D-00101  9  LOFD-0 01020 / TDLOF D-00102  0	SRVCC to UTRAN  SRVCC to GERAN  CS Fallback to UTRAN  CS Fallback to GERAN  PS Inter- RAT Mobility between E- UTRAN and UTRAN  PS Inter- RAT Mobility between E- UTRAN and GERAN	Meaning: Indicates the handover method switches based on which the eNodeB determines handover policies. BlindHoSwitch: This option specifies whether to enable blind handover for CSFB. Bind handover for CSFB is enabled only if this option is selected. A blind handover for CSFB can be triggered only if both this option and the BlindHoSwitch option of the HoModeSwitch parameter in the ENodeBAalgoSwitch MO are selected.  UtranPsHoSwitch: PS handover to UTRAN is supported only if this option is selected. This option takes effect only if the eNodeB-level option UtranPsHoSwitch of the HoModeSwitch parameter in the ENodeBAalgoSwitch MO is deselected.  UtranSrvccSwitch: SRVCC to UTRAN is supported only if this option is selected. This option takes effect only if the eNodeB-level option UtranSrvccSwitch of the HoModeSwitch parameter in the ENodeBAalgoSwitch MO is deselected.  GeranSrvccSwitch: SRVCC to GERAN is supported only if this option is selected. This option takes effect only if the eNodeB-level option GeranSrvccSwitch of the HoModeSwitch parameter in the ENodeBAalgoSwitch MO is deselected.  UtranRedirectSwitch: Redirection to UTRAN is supported only if this option is selected. This option takes effect only if the eNodeB-level option UtranRedirectSwitch of the HoModeSwitch parameter in the ENodeBAalgoSwitch MO is deselected.  GeranRedirectSwitch: Redirection to GERAN is supported only if this option is selected. This option

MO	Parameter ID	MML Command	Feature ID	Feature Name	Description
			TDLOF D-081223 TDLOF D-081203	Ultra-Flash CSFB to UTRAN Ultra-Flash CSFB to GERAN	<p>takes effect only if the eNodeB-level option GeranRedirectSwitch of the HoModeSwitch parameter in the ENodeBAalgoSwitch MO is deselected. UFCsfBBlindHoDisSwitch: If both this option and the BlindHoSwitch option of the same parameter are selected, a UE is handed over to a UTRAN or GERAN cell based on measurement results using ultra-flash CS fallback. If this option is deselected and the BlindHoSwitch option of the same parameter is selected, a UE can be blindly handed over to a UTRAN or GERAN cell using ultra-flash CS fallback.
